

CDS Obolus

Self-service banknotes deposit system.

Banking solutions
according to the
retailers.

Automatic and immediate balance Security of the cash in the P.O.S (Point of Sale)

The Obolus Deposit system developed by Sallén, represents a new concept for the cash handling in a retail environment.

Using the same technology as the one trusted by thousands of bank branches in more than 15 countries, Sallén presents Obolus, "self-service" cash deposit device designed to make retail cash handling secure, efficient and cost-effective.

With the Obolus CDS installed in a Retail Center, the user will be informed about each deposit transaction at real time, it is also possible to have the own control of all the deposited banknotes in a bank office which makes an automatic and immediate balance possible. It ensures takings are accurately reconciled and verified at the point of their deposit. Obolus enables making large deposits quick and easy to process.

Reduced risks to the maximum

Obolus is designed to secure back office cash handling. The retailer can make small deposits during all the working day to reduce the amount of cash "exposed" within the cash drawer, besides having a detailed control of all the takings at real time.

Easy to process:

1.- User's identification: User security is ensured using the pin Key board or badge reader.

2.-Automatic verification and counting process: All the banknotes are authenticated and verified before being stored inside a safety box, rejecting the suspicious banknotes in order to be later controlled and analyzed.

3.-Printing receipt ticket: Once the counting and verification process has been carried out in all the banknotes, the user will proceed to print a receipt ticket.

4.-Sending the deposit information to a central server at real time: Making the sending automatically, it is possible to get access to the information of all the users and all the centers in a centralized way. In this way, repeated and time-consuming manual counting is eliminated, and

the risk of mistakes, shrinkage and waiting time is reduced to a minimum.

Security and Marking of takings

When the staff in charge of moving the banknotes sends the order of opening the door of the system, the sealant specially designed by Sallén will proceed to seal the bag, so the bag will be totally closed before the door gets opened (self-sealing)

Through this sealing, it is guaranteed that there is no possible access to the banknotes until the bag is opened in the bank office, being detected any kind of sabotage in the bag.

Once the safety bag is removed, the person in charge of the transportation of this cash bag will place a new one (only one use bag) so that it is possible to use the Cash deposit system immediately.

Information transmission and cash control at real time

Obolus provides the possibility to print numerous types and styles of reports or receipts for audit and CIT collection purposes.

With the integrated management information software running, Obolus records the value of the deposit transaction and together with the customer's details it is sent securely through a TCP/IP connection over the Web to the bank or CIT where it can be instantly reconciled and applied to the customer's bank account. The information could also be used to arrange a just-in-time CIT collection.

The Web applicative will allow the user to get access to these data in a safe way everywhere, contributing different functions as well as consults by operator, totals control of the Acceptors, alarms management according to configurable parameters.

With all the transaction registered on-line, Obolus will give to the retailer a better control of the physical flow of cash while reducing Shrinkage, keeping to a minimum and providing an up-to-date source of information for statistics and reports.

Technical features

- 300 / 600 banknotes per minute
- Feeder capacity: 300 banknotes
- Rejects capacity: 25 banknotes
- Deposits bag capacity: 3000 / 5000 banknotes (only one use)
- Thermal ticket printer
- Large dimensions tactile screen
- Bare code reader
- Box for other deposits
- Automatic i-button identifier
- Total traceability for sacks and envelopes for non identified banknotes, cheques and coupons

- Users personalized management
- TCP / IP, GPRS, USB communication
- It is in accordance with Standards for disabled people
- Allows customer personalization
- Safety box depending on customer features: CEN 3, CEN 4, etc...

• Measures :

- Height 126 cm
- Width 60 cm
- Depth 57 cm
- Weight Depending on Safety Box
